

TrustView: Certificate automation (add-on module)

Deploy certificates and fix vulnerabilities with a single click. With this add-on module you can manage the full certificate lifecycle management process directly from TrustView. Ordering, storing, deployment and renewal are no longer time-consuming and error-prone tasks. Using TrustView you can manage the processes in one central place and the automation helps you work efficiently and avoid manual processes.

One-click certificate management

Companies and organisations are today using many resources on managing the SSL/TLS certificates securing communication to websites, self-service portals and secure e-mail communication. Managing all of these certificates includes certificate issuance, renewal and configuration.

The TrustView automation module supports deployment of certificate to Windows Server with a single click. You can deploy the certificate to the truststore on the server and optionally bind the certificate to a website on an Internet Information Server (IIS). The complete process is handled directly from TrustView and requires no login to the managed server. You simply select the server and a certificate and click "OK".

Fix vulnerabilities the easy way

Many default TLS/SSL configurations are vulnerable to protocol level vulnerabilities, such as *Heartbleed*, *Poodle*, *Freak* and *LogJam*. It can take many resources to manually protect against such vulnerabilities. The TrustView automation module also includes functionality automating this time-consuming task.

Client configuration

Installing the client-side script is done using one of the two following methods:

- i) Let TrustView logon remotely to the client and install the script. No manual logon to the client is required in this scenario.
- ii) Download the install script from TrustView and run it manually on the client.

Getting started is easy

To get you off to a good start, every TrustView installation includes a hands-on workshop introducing you to the TrustView functionality and setting up the automation on clients.
